

Fruit of climate change

Brookline, Mass.: Re “How climate change might eliminate strawberries” (March 7): Carbon emissions cause global warming, which causes climatic changes that may destroy our strawberry farming, and force all food industries to adapt. Whenever I read about climate change causing food disruptions, I ask my scientist husband if it’s worrisome. He typically says: Climate change presents many threats, but the most serious, irreversible, most expensive, potentially catastrophic threat is rising seas. Strawberries are delightful treats, but the main course is sea rise. *Judy Weiss*
